

Research

Hi Bob,

I know system flexibility and faster computing and has always been of interest, so passing this along for your assessment.

We're working with a vendor named Liquid who builds really, really dense GPU servers (think 20-30 GPUs per server).

The resulting denser servers = faster servers with less infrastructure/power/cooling needed for platforms like Research Computing, AI, VDI, etc).

Further, they leverage components from Dell, Nvidia, AMD, etc (brands already in your environment) and the flexibility allows for a mixture of GPU (and other accelerators) to be used in the same cluster.

Are you open to a quick session to see if there is value in digging deeper on this?

Thanks,
Bob
